PXi Sony Ericsson concept mimics iPhone

Imaginary phone may become reality next week

by Stuart Miles published on 31 October 2007

Independent concept designer Bence Bogar clearly couldn't wait for the new Sony Ericsson handset to be announced on the 6 November so has come up with his own concept device.

Called the SE PXi, the concept design sports a magnesium body framing a big 3.3-inch touchscreen similar to the iPhone.

The screen rotates automatically and is optimised for both finger and stylus input.

The right side of the unit houses a jogdial and a secondary touchscreen, which adapts to whatever app is currently open. The smartphone also sports not 1 but 2 memory card slots.

Imaginary specs include stereo speakers and a Cyber-shot 5 megapixel camera.

Pocket-lint will be covering the Sony Ericsson Spring line-up on 6th November.

We will keep you posted.
