RIM patents new BlackBerry keypad design

Angular effort could be coming soon

by Amy-Mae Elliott published on 28 December 2007

A recently revealed RIM patent shows a different design for the much-loved BlackBerry keypad. With the claim that it makes inputting easier, the design shows a more angular slant that BlackBerry users will be used to.

What's more interesting is that this is said to be a possibility not just for more traditional RIM handsets, but to be the on-screen keyboard for the much-rumoured touchscreen BlackBerry.
