Introducing Flame, world's most advanced walking robot

Walks all over ASIMO

by Amy-Mae Elliott published on 23 May 2008

"Flame" from Dutch PhD student Daan Hobbelen might just look like A.N. Other humanoid, but it's so not.

You're looking at what is the world's most advanced walking robot thanks to seven motors and a balance mechanism with stability algorithms.

Aside from being a cool looking bot, Flame will help research into how humans with walking difficulties can be treated.
