Imation Nano Flash Drive goes small

Bigger memory, but small size

by Stuart Miles published on 29 May 2008

Like your memory small? Imation hopes so, it has just launched what it says is its smallest flash drive to date.

Measuring 44 x 15 x 10mm, the Imation Nano Flash Drive has the smallest form factor of the Imation swivel USB drives.

Available in capacities from 1GB to 8GB (including 2GB and 4GB models) the drive will offer password protection and drive partitioning software as well as being enhanced for Windows Vista ReadyBoost.

No word on yet on pricing although you can probably expect to lose the device soon after you've bought it due to the small size.
