## Art Lebedev designs a mobile phone

### Scartel concept revealed

by Amy-Mae Elliott published on 25 September 2008

Russian design geniuses (genii?) at the Art Lebedev studio have turned their attentions to the humble mobile phone.

With the design brief to develop a draft design concept for a mobile device, the mock-up, for company Scartel is a fairly minimalist effort with, sadly, no programmable OLED keys.

What it does get is WiMAX support, as well as Wi-Fi and tri-band GSM capabilities.

That touchscreen has a 850 x 480 pixel resolution, there's an auxiliary five-position joystick control and two cameras - one front and back.

Other features visible in the pic are a headphone jack, USB connectivity and a microSD card slot.

There's no word from the Lebedevs on whether this will go from concept to actual product, we guess that's down to Scartel.
