Maxfield launch world's fastest satnav, the Max Track

Powered by a 400MHz processor

by Amber Maitland published on 16 October 2006

German company Maxfield has unveiled the MAX TRACK, which the company claims is the fastest satnav on the market.

It's powered by a 400MHz processor made by Samsung, runs on Windows CE 5.0, and incorporates MAX-Navigator 5 software.

The device has an integrated GPS antenna, and comes with most of the map database of Western Europe pre-loaded on a 1GB SD card. It supports cross-border navigation rerouting on the fly.

A 3.5-inch colour touchscreen makes it easy to enter addresses and destinations, and the software allows you to block specific streets or to indicate a preferred route. Instructions can be listened to on stereo speakers or through headphones.

Other functions include a speedometer that works with the speed camera database, and a choice of 2D or 3D maps.

Look out for this latest satnav to hit the shelves in November.
