Budget GPS PDA to come from Trimble

Trimble sets to cut costs for the mobile workforce

by Ryan Haynes published on 27 April 2007

Trimble has taken it on itself to launch a budget model PDA for the ever-growing mobile workforce.

The Juno ST is meant to keep employees in contact, continue working and make locating much easier at a low-price. This low-price is still yet to be announced, but since it seems to be for business we assume buying in bulk may reduce the cost.

With the key features of a PDA, the outdoor worker may be kept on their toes with this device. The handheld features a 300MHz processor running on Windows Mobile 5 with a "high-sensitivity" GPS receiver.

It has wireless connectivity through Wi-Fi and Bluetooth with room for extra memory with its SD slot. The display screen is 2.8-inch with the Juno ST claiming to be especially skilled at locating a signal in "hostile environments", and we think it will work with the company's entire line of mapping and GIS software.

The Trimble model is expected in May.
