Heated computer keyboard

Keeping your circulation flowing...

by Amy-Mae Elliott published on 22 May 2007

Boasting to be the first heated computer keyboard to the market, the USB compatible V8 WK001 has two heat settings, Low Heat (85F to 90F) which is described as "normal hand temperature" and High Heat (95F to 100F) which is "normal body temperature".

It's certainly been hit by the ugly stick - our hands would have to be in second stage frost-bite before we stuck this in our cubicleÖ

The WK001 costs \$43.59 and is available from ToolTopia via the link below.
