Logitech VX Nano mouse launched

New travel focused mouse announced

by Stuart Miles published on 23 July 2007

Logitech has launched a new portable mouse aimed at the business traveller today.

Called the VX Nano, the cordless laser mouse for notebooks will come with a tiny USB dongle that allows the mouse to work via a 2.4GHz wireless connection rather than relying on your computer to have Bluetooth.

The device is so small, that Logitech say that users won't need to remove it when it comes to stowing their machine.

The five button mouse will also sport a search button and the super fast scrolling functionality found on the company's MX Revolution mouse launched last year. It allows users to disengage the mouse wheel from its gears for faster spinning.

Costing £50 when it launches later this year in the UK, Logitech are hoping that people will prefer comfort over the ability to fit the unit in their laptop's PC Express Card Slot.
